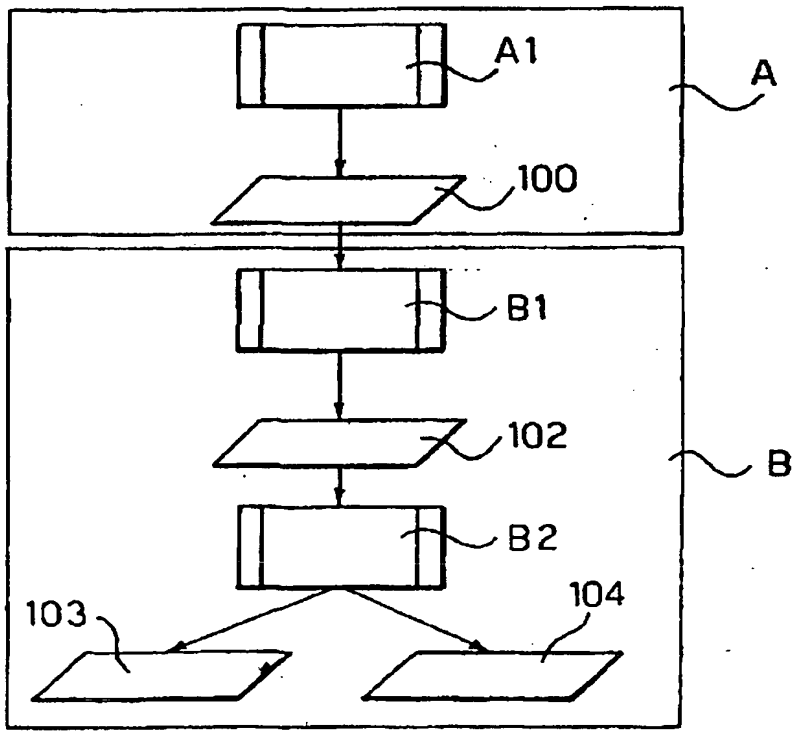
(54) Title: PROCEDURE AND SYSTEM FOR THE ANALYSIS AND THE EVALUATION OF THE CONDITIONS FOR ACCESSING DATA COMMUNICATION NETWORKS, AND RELATIVE COMPUTER PROGRAM PRODUCT



(57) Abstract: The system is configured to trace (A1) the Internet traffic of a user (LAN) and identify a group of networks with which this traffic can mainly transit, by identifying (100) the relative autonomous systems and tracing the sequence of autonomous systems (AS) crossed by the traffic. To trace said sequence, a first module (B1) provides the list (102) of autonomous system paths crossed by said traffic to reach each destination, and a second module (B2) aggregates the aforesaid list of paths, and outputs a tree representing all the paths of the autonomous systems crossed by the user's traffic (LAN) to reach all the relative destinations.
